

Axial piston variable pump (A)A4VSO Series 1X and 30

Americas

- ▶ Robust high-pressure pump for industrial applications
- ▶ Size 40 ... 1000
- ▶ Nominal pressure 5100 psi (350 bar)
- ▶ Maximum pressure 5800 psi (400 bar)
- ▶ Open circuit

Features

- ▶ Variable pump with axial piston rotary group of swash-plate design for hydrostatic drives in open circuit
- ▶ Flow is proportional to the drive speed and displacement.
- ▶ The flow can be infinitely varied by adjusting the swash-plate angle.
- ▶ Excellent suction performance
- ▶ Low noise level
- ▶ Long service life
- ▶ Modular design
- ▶ Variable through drive options
- ▶ Visual swivel angle indicator
- ▶ Freely variable installation position
- ▶ Suitable for variable-speed drives
- ▶ HF mode for reduced data possible for HFC mode, special version available

Notice

- ▶ Observe the project planning notes (page 68).
- ▶ In addition to the type code, please specify the relevant technical data when placing your order.
- ▶ For notes on combination pumps, see page 65

Hydraulic fluids

The A4VSO, A4VSLO variable pump is designed for operation with HLP mineral oil according to DIN 51524.

Application instructions and requirements for hydraulic fluids should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally acceptable hydraulic fluids
- ▶ 90222: Fire-resistant, water-free hydraulic fluids (HFDR/HFDU)
- ▶ 90235 Assessment of hydraulic fluids used in Rexroth hydraulic components (pumps and motors)
- ▶ 90245 Bosch Rexroth fluid rating list for Rexroth hydraulic components (pumps and motors)
- ▶ 90223: Fire-resistant, water-containing hydraulic fluids (HFAX, HFB, HCF)

Selection of hydraulic fluid

Bosch Rexroth evaluates hydraulic fluids using the Fluid Rating according to data sheet 90235.

Hydraulic fluids rated positive in the Fluid Rating can be found in the following data sheet:

- ▶ 90245: Bosch Rexroth Fluid Rating List for Rexroth hydraulic components (pumps and motors)

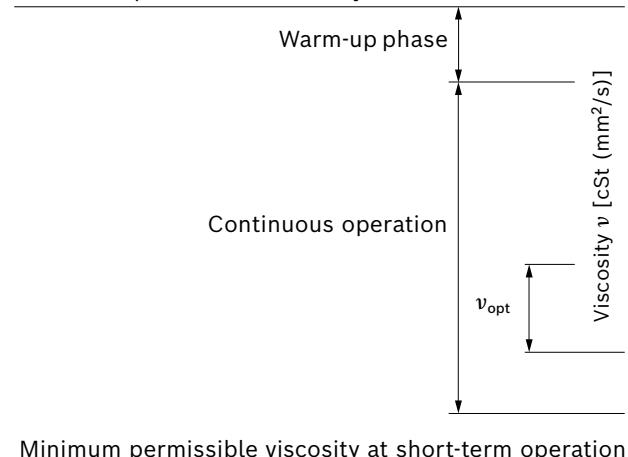

The hydraulic fluid should be selected so that the operating viscosity in the operating temperature range is within the optimum range (ν_{opt} see selection diagram).

Viscosity and temperature of hydraulic fluids

	Viscosity	Shaft seal	Temperature³⁾	Comment
Cold start	$\nu_{\text{max}} \leq 1600 \text{ cSt} (\text{mm}^2/\text{s})$	NBR ²⁾	$\theta_{\text{st}} \geq -40^\circ\text{F} (-40^\circ\text{C})$	$t \leq 3 \text{ min}$, without load ($p \leq 725 \text{ psi}$), $n \leq 1000 \text{ rpm}$ Permissible temperature difference between axial piston unit and hydraulic fluid in the system maximum 25 K
		FKM	$\theta_{\text{st}} \geq -13^\circ\text{F} (-25^\circ\text{C})$	
Warm-up phase	$\nu = 1600 \dots 400 \text{ cSt} (\text{mm}^2/\text{s})$			$t \leq 15 \text{ min}$, $p \leq 0.7 \times p_{\text{nom}}$ and $n \leq 0.5 \times n_{\text{nom}}$
Continuous operation	$\nu = 400 \dots 10 \text{ cSt} (\text{mm}^2/\text{s})^1$	NBR ²⁾	$\theta \leq +185^\circ\text{F} (+85^\circ\text{C})$	measured at port T
		FKM	$\theta \leq +230^\circ\text{F} (+110^\circ\text{C})$	
	$\nu_{\text{opt}} = 36 \dots 16 \text{ cSt} (\text{mm}^2/\text{s})$			Range of optimum operating viscosity and efficiency
Short-term operation	$\nu_{\text{min}} = 10 \dots 7 \text{ cSt} (\text{mm}^2/\text{s})$	NBR ²⁾	$\theta \leq +185^\circ\text{F} (+85^\circ\text{C})$	$t \leq 3 \text{ min}$, $p \leq 0.3 \times p_{\text{nom}}$, measured at port T
		FKM	$\theta \leq +230^\circ\text{F} (+110^\circ\text{C})$	

▼ Selection diagram

Maximum permissible viscosity for cold start

Minimum permissible viscosity at short-term operation

¹⁾ This corresponds, for example on VG 46, to a temperature range of $+4^\circ\text{C}$ to $+85^\circ\text{C}$ (see selection diagram)

²⁾ Special Version please contact us.

Bosch Rexroth AG, RE-A 92050/2020-02-28

³⁾ If the temperature at extreme operating parameters cannot be adhered to, please contact us.

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

At a hydraulic fluid viscosity of less than 10 cSt (mm^2/s) (e.g. due to high temperatures during short-time duty) at the drain port, a cleanliness level of at least 19/17/14 according to ISO 4406 is required.

For example, the viscosity corresponds to 10 cSt (mm^2/s):

- HLP 32 at a temperature of 163 °F (73 °C)
- HLP 46 at a temperature of 185 °F (85 °C)

Bearing flushing

For the following operating conditions bearing flushing is required for a safe, continuous operation:

- Applications with special fluids (not mineral fluids) due to limited lubricity and narrow operating temperature range
- Operation with borderline conditions for temperature and viscosity during operation with mineral oil

With vertical installation (drive shaft facing upwards) bearing flushing is recommended for lubricating the front bearing and the shaft seal.

Bearing flushing is realized at port **U** in the area of the front flange of the variable pump. The flushing fluid flows through the front bearing and discharges with the pump drain at the drain port.

Depending on the individual sizes, the following flushing flows are recommended:

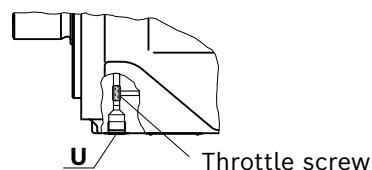

NG	40	71	125	180	250	355	500	750	1000
q_{sp} gpm	0.8	1.0	1.3	1.8	2.6	4.0	5.3	7.9	10.6
q_{sp} (l/min)	(3)	(4)	(5)	(7)	(10)	(15)	(20)	(30)	(40)

For the flushing flows stated, there is a pressure differential of about 30 or 45 psi (2 or 3 bar) between port **U** (including fitting) and the drain chamber (series 1x and series 3x, respectively).

For version F (order position 09), the corresponding flushing quantities in accordance with data sheet 92053 must be observed.

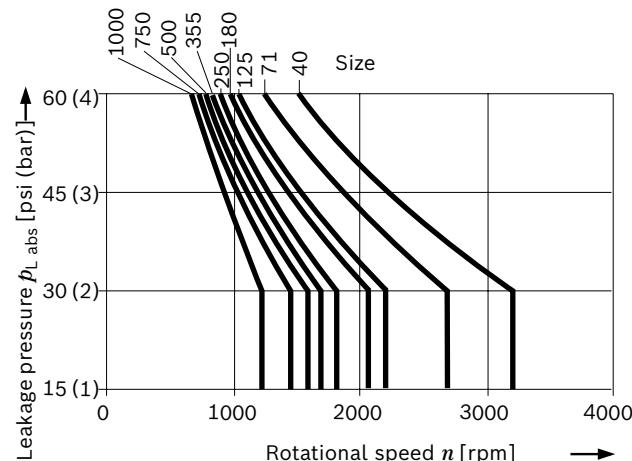

Notice regarding series 30

When using external bearing flushing, the throttle screw in port **U** must be turned in to the end stop.

Leakage pressure

The permissible leakage pressure (case pressure) depends on the rotational speed (see diagram).

Maximum leakage pressure (case pressure)

$p_{L,abs}$ max 60 psi (4 bar) absolute

These data are guideline figures; a restriction may be necessary under certain operating conditions.

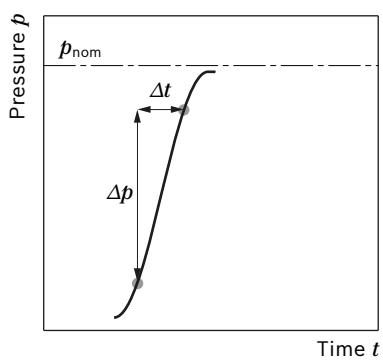

Flow direction

S to **B**

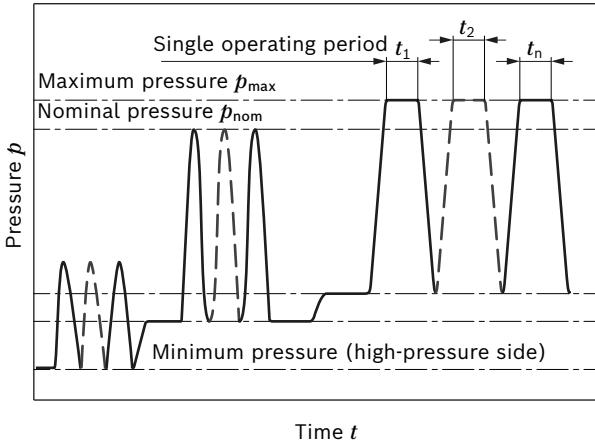

Working pressure range

Pressure at working port B	Definition
Nominal pressure p_{nom}	5100 psi (350 bar)
Maximum pressure p_{max}	5800 psi (400 bar)
maximum Single operating period	1 s
Total operating period	300 h
Minimum pressure $p_{\text{B abs}}$ (High-pressure side)	220 psi (15 bar) ¹⁾
Rate of pressure change $R_{\text{A max}}$	232000 psi /s (16000 bar/s)
	Maximum permissible pressure build-up and reduction speed during a pressure change across the entire pressure range.
Pressure at suction port S (inlet)	
Version without charge pump	Minimum pressure at suction port S (inlet) which is required to prevent damage to the axial piston unit. The minimum required pressure is dependent on the rotational speed and displacement of the axial piston unit (see diagram "Maximum permissible speed" on page 11).
Minimum pressure $p_{\text{s min}}$	≥ 12 psi (0.8 bar) absolute
Maximum pressure $p_{\text{s max}}$	≤ 435 psi (30 bar)
Case pressure at port T, K ₁ , K ₂ , R(L)	
Maximum static pressure $p_{\text{L max}}$	60 psi (4 bar)
	Maximum 17 psi (1.2 bar) higher than inlet pressure at port S , but not higher than $p_{\text{L max}}$. A drain line to the reservoir is required.
Pressure peaks $p_{\text{L peak}}$	90 psi (6 bar)
	$t < 0.1$ s

▼ Rate of pressure change $R_{\text{A max}}$

▼ Pressure definition

$$\text{Total operating period} = t_1 + t_2 + \dots + t_n$$

- 6) For suction pressure < 15psi (1 bar) see diagram Maximum rotational speed (speed limit) no rotational speed increase possible when the inlet pressure increases.

Maximum permissible speed (speed limit)
 $p_{S \text{ abs}}$ = Inlet pressure [bar]

Maximal permissible speed at High Speed size 71

Determining the characteristics

Flow	$q_v = \frac{V_g \times n \times \eta_v}{231}$	[gpm]
	$q_v = \frac{V_g \times n \times \eta_v}{1000}$	[l/min]
Torque	$M = \frac{V_g \times \Delta p}{24 \times \pi \times \eta_{hm}}$	[lb-ft]
	$M = \frac{V_g \times \Delta p}{20 \times \pi \times \eta_{hm}}$	[Nm]
Power	$P = \frac{2 \pi \times M \times n}{33000} = \frac{q_v \times \Delta p}{1714 \times \eta_t}$	[HP]
	$P = \frac{2 \pi \times M \times n}{60000} = \frac{q_v \times \Delta p}{600 \times \eta_t}$	[kW]
Key		
V_g	=	Displacement per revolution [$\text{in}^3 (\text{cm}^3)$]
Δp	=	Differential pressure [psi (bar)]
n	=	Rotational speed [rpm]
η_v	=	Volumetric efficiency
η_{hm}	=	Hydraulic-mechanical efficiency
η_t	=	Total efficiency ($\eta_t = \eta_v \times \eta_{hm}$)

Notices

- ▶ Theoretical values, without efficiency and tolerances; values rounded
- ▶ Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. We recommend testing the loads by means of experiment or calculation / simulation and comparison with the permissible values.
- ▶ Special requirements apply in the case of belt drives. Please contact us.

Permissible radial and axial forces of the drive shafts

Overview of control devices

Pressure controller DR (for further information, see data sheet 92060)

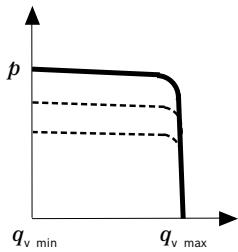

The pressure controller limits the maximum pressure at the pump outlet within the control range of the variable pump. The variable pump only supplies as much hydraulic fluid as is required by the consumers. If the working pressure exceeds the pressure command value at the pressure valve, the pump will regulate to a smaller displacement to reduce the control differential.

- ▶ Initial position in depressurized state: $V_g \text{ max}$.
- ▶ Setting range for pressure control: 725 to 5100 psi (50 to 350 bar).
Standard is 5100 psi (350 bar).

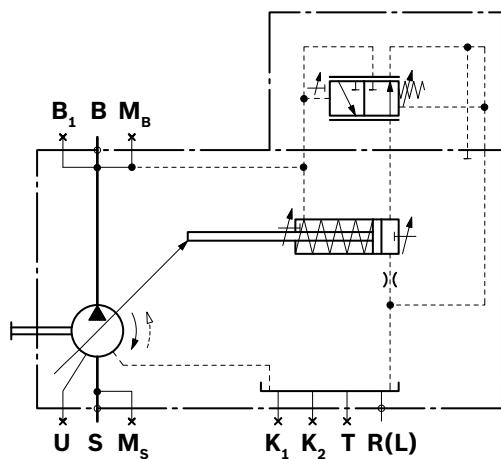

Optional:

- ▶ Pressure controller, remotely operated (DRG)

▼ Characteristic curve

▼ Circuit diagram

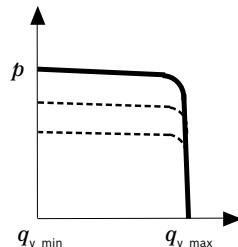

Pressure controller for parallel operation DP (for further information, see data sheet 92060)

Suitable for pressure control of multiple axial piston units A4VSO in parallel operation.

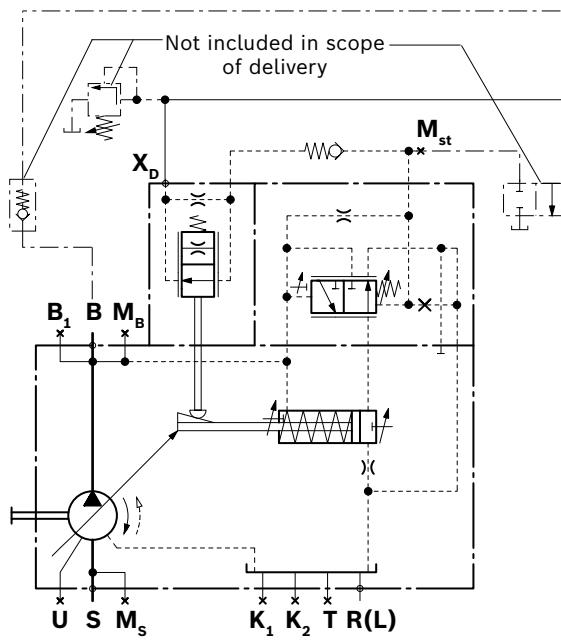

Optional:

- ▶ with flow control (DPF)

▼ Characteristic curve

▼ Circuit diagram

Flow controller FR

(for further information, see data sheet 92060)

The flow controller adjusts the displacement of the pump to the volume required by the consumer.

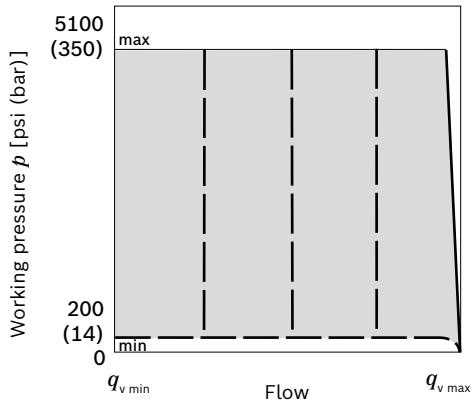

The flow of the pump is then dependent on the cross section of the external metering orifice (pos. 4), which is located between the pump and the consumer. The flow is nearly independent of the load pressure within the control range of the pump.

Initial position in depressurized state: $V_g \text{ max}$

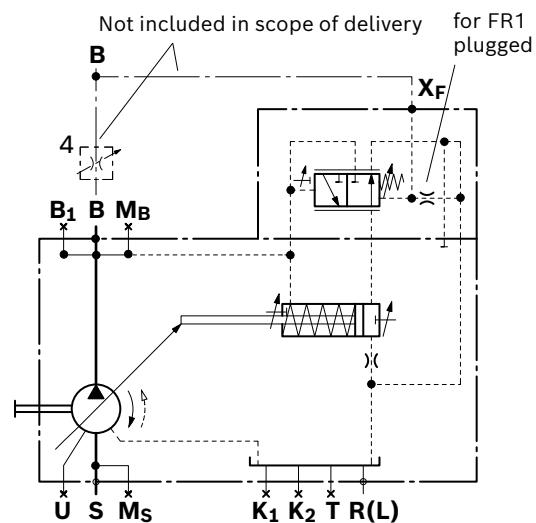

Mechanical minimum and maximum swivel angle limitation

- The $V_g \text{ min}$ stop is set so that a pressure of 220 to 290 psi (15 to 20 bar) is set when port **B** is plugged.
- The $V_g \text{ max}$ stop is set to nominal $V_g \text{ max}$. When ordering, please state other settings values in plain text (possible setting ranges $V_g \text{ max}$ to 50 % $V_g \text{ max}$).

▼ Characteristic curve

▼ Schematic, example sizes 40 and 71

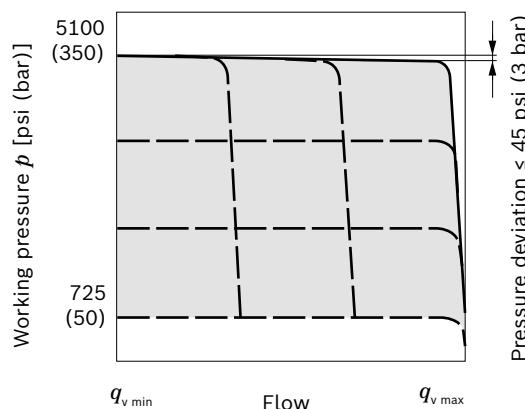

Pressure and flow controller DFR

(for further information, see data sheet 92060)

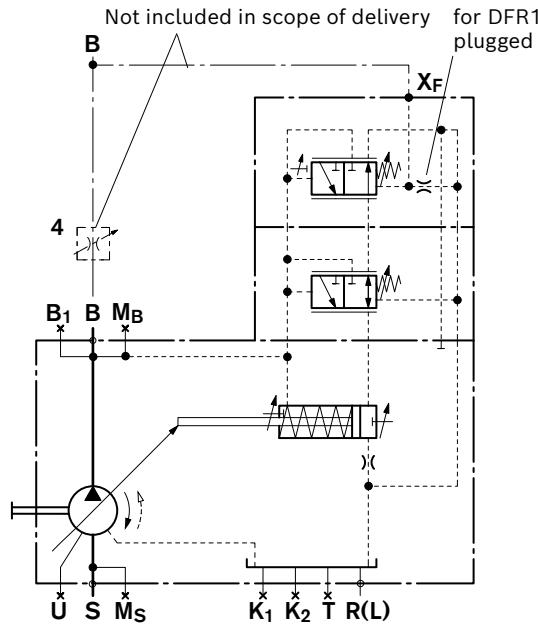

The pressure and flow controller is a combination of the DR pressure controller and FR flow controller.

Optional: FRG, FRG1 for remote pressure and flow.

▼ Characteristic curve

Schematic, example sizes 40 and 71

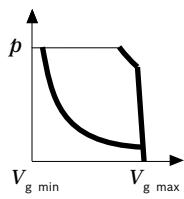

Power controller LR2 with hyperbolic characteristic curve (for further information, see data sheet 92064)

The hyperbolic power controller keeps the specified drive power constant at the same drive speed.

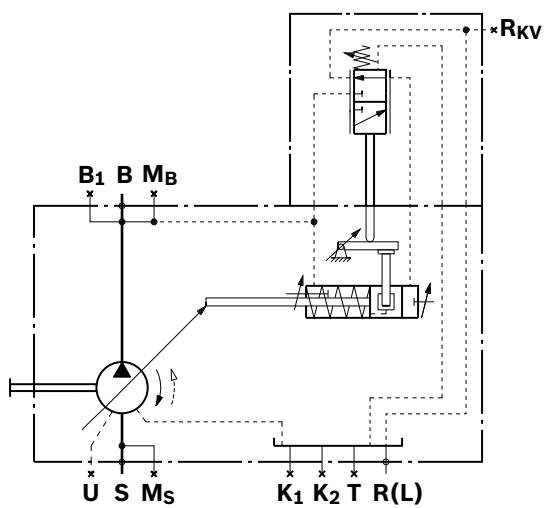

Optional:

- ▶ Pressure control (LR2D), remotely controllable (LR2G);
- ▶ Flow control (LR2F, LR2S);
- ▶ Hydraulic stroke limiter (LR2H);
- ▶ Mechanical stroke limiter (LR2Z);
- ▶ Hydraulic two-point control (LR2Z);
- ▶ With electric unloading valve as starting aid (LR2Y).

▼ Characteristic curve

▼ Circuit diagram

Power controller LR3 with remotely controllable power characteristic

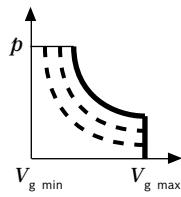

(for further information, see data sheet 92064)

This hyperbolic power controller keeps the specified drive power constant, whereby the power characteristic is adjustable remotely.

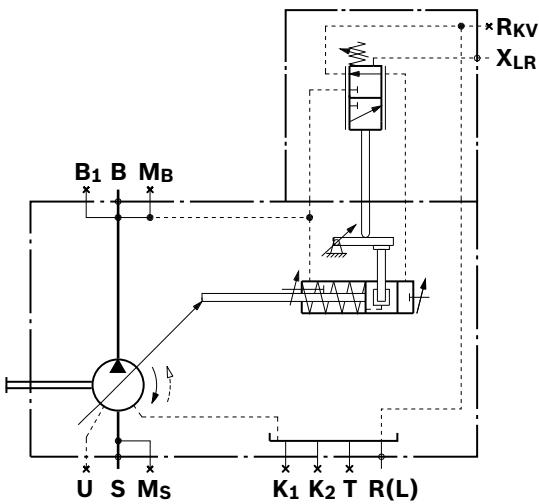

Optional:

- ▶ Pressure control (LR3D), remotely controllable (LR3G);
- ▶ Flow control (LR3F, LR3S);
- ▶ Hydraulic stroke limiter (LR3H);
- ▶ Mechanical stroke limiter (LR3Z);
- ▶ Hydraulic two-point control (LR3Z);
- ▶ With electric unloading valve as starting aid (LR3Y).

▼ Characteristic curve

▼ Circuit diagram

Hydraulic adjustment LR2N and LR3N pilot-pressure dependent, basic setting $V_{g \min}$
 (for further information, see data sheet 92064)

With superimposed power control.

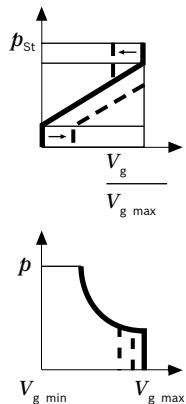

The displacement volume is adjusted proportionally to the pilot pressure in P_{St} .

The additional hyperbola power controller is superimposed on the pilot pressure signal and keeps the specified drive output constant.

Optional:

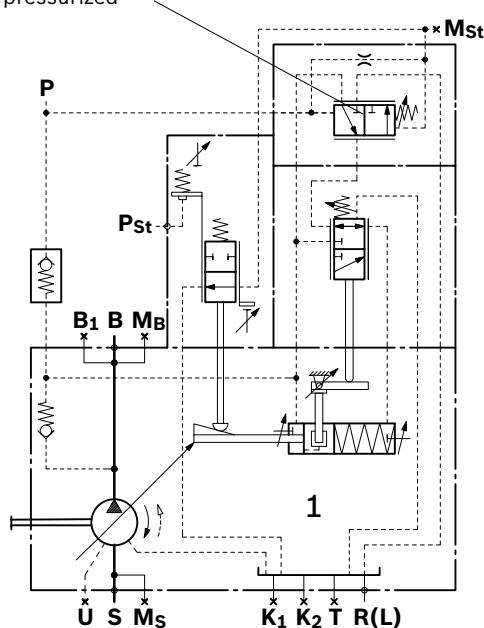

- Power characteristics, remotely controllable (LR3N)
- Pressure control (LR.DN),
- Remote pressure control (LR.GN)
- Electrical control of pilot pressure (LR, NT)

▼ Characteristic curve

▼ Circuit diagram

Shown in switched position,
 i.e. P pressurized

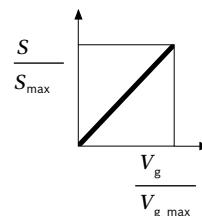

Manual control MA

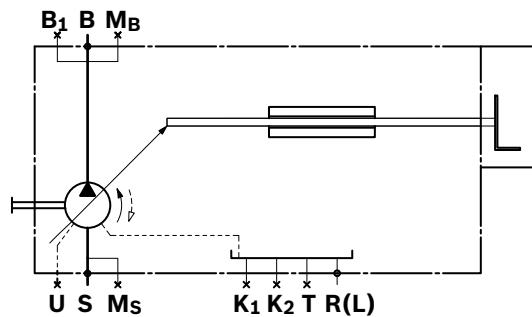

(for further information, see data sheet 92072)

Stepless adjustment of displacement volume by means of a handwheel.

▼ Characteristic curve

▼ Circuit diagram

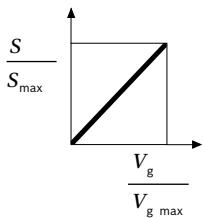

Electric motor control EM

(for further information, see data sheet 92072)

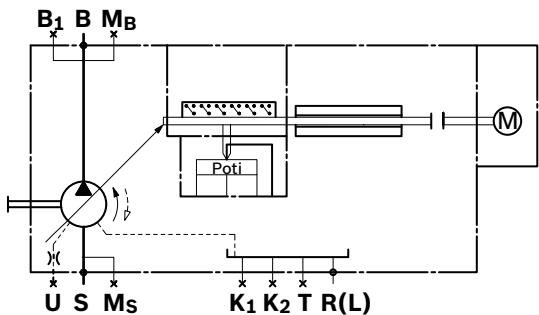

Stepless adjustment of displacement volume by means of the electric motor control EM.

Various intermediate displacement values can be selected with a programmed sequence control by means of built on limit switches and an optional potentiometer for feedback of the swivel angle.

▼ Characteristic curve

▼ Circuit diagram

Hydraulic adjustment HD, pilot-pressure dependent

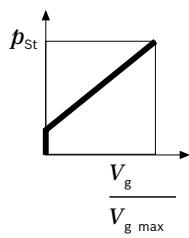

(for further information see data sheet 92080)

Stepless adjustment of the pump displacement according to the pilot pressure. The control is proportional to the specified pilot pressure (difference between pilot pressure and case pressure).

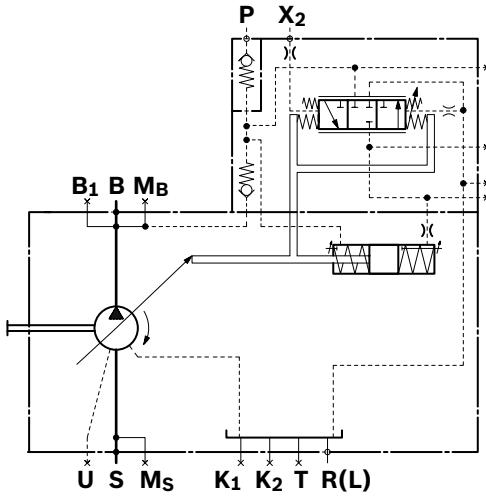

Optional:

- ▶ Control characteristics (HD1, HD2, HD3)
- ▶ Pressure control (HD.B),
- ▶ Remote pressure control (HD.GB)
- ▶ Power control (HD1P)
- ▶ Electrical control of pilot pressure (HD1T)

▼ Characteristic curve

▼ Circuit diagram

Hydraulic adjustment HM 1/2, quantity-dependent

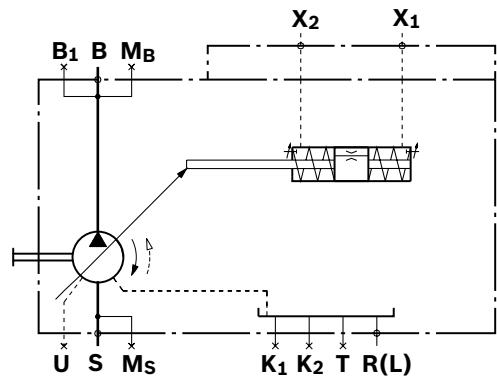

(for further information see data sheet 92076)

The pump displacement can be steplessly varied in relation to the control oil volume in ports **X₁** and **X₂**.

Application:

- 2-point circuit
- Base device for servo or proportional controls

▼ Circuit diagram

Control system HS, HS5, with servo or proportional valve

(for further information, see data sheet 92076)

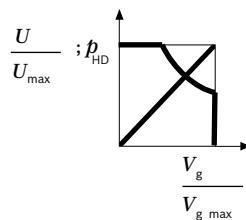

The stepless displacement control is accomplished by means of a servo or proportional valve and electrical feedback of the swivel angle.

The HS5P control system is equipped with a mounted pressure transducer, which means that it can be used for electric pressure and power control.

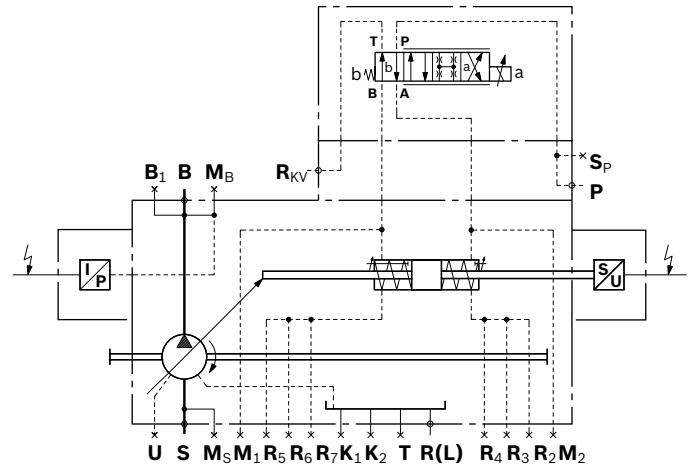

Optional:

- Servo valve (HS);
- Proportional valve (HS5);
- Short circuit valve (HSK, HS5K, HS5KP);
- For the submerged oil insert (HS5M);
- With internal control pressure supply (HS5V);
- Control system with integrated **On Board Electronics** OBE (HS5E).

▼ Characteristic curve

▼ Schematic NG 125 and 180 HS5P

Control system EO

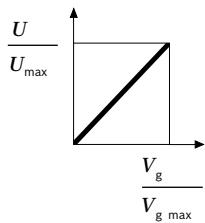

(for further information, see data sheet 92076)

The stepless control of the displacement flow is accomplished by means of a proportional valve and electrical feedback of the swivel angle. Thus, the control can be used as an electric displacement control.

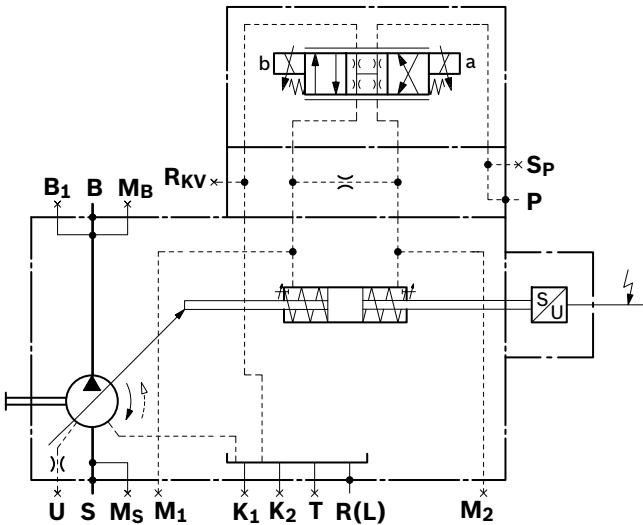

Optional:

- ▶ Control pressure range (EO1, EO2)
- ▶ Short circuit valve (EO1K, EO2K)
- ▶ Without valves (EO1E, EO2E)

▼ Characteristic curve

▼ Circuit diagram

Speed control DS2, secondary-controlled

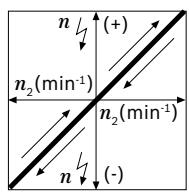

(for further information, see data sheet 92057)

The speed control DS2 controls the secondary unit in such a manner, that this motor delivers sufficient torque to maintain the required rotational speed.

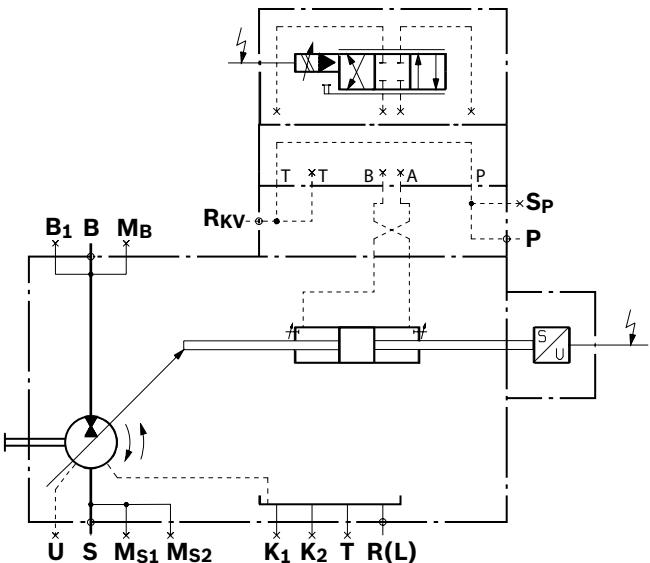

► This torque is

- in the network with impressed pressure
- proportional to the displacement volume and therefore proportional to the swivel angle.

▼ Characteristic curve

▼ Circuit diagram

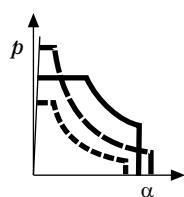

Electrohydraulic control system DFE1

(for further information, see data sheet 92088)

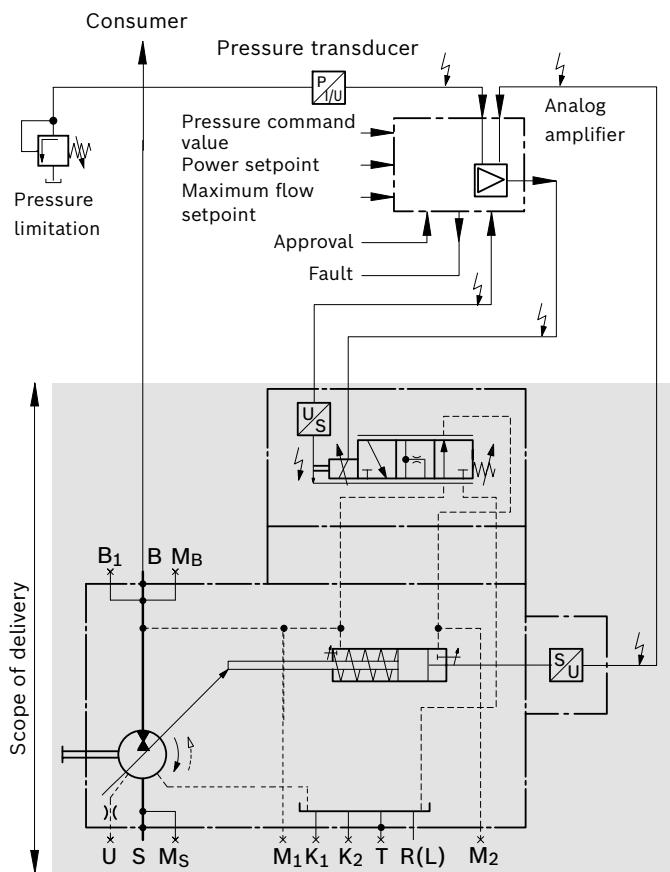

An electrically actuated proportional valve controls the power, pressure and swivel angle of the A4V.SO...DFE1 variable pump. The current at the proportional valve determines the position of the swashplate angle and thus the flow of the pump via the stroking piston and the position transducer.

With the electric motor switched off and actuator system depressurized, the pump swivels to maximum displacement ($V_{g \max}$) through spring force.

o = On request

By using combination pumps, it is possible to have independent circuits without the need for splitter gearboxes. When ordering combination pumps, the type designations of the 1st and 2nd pumps must be connected with a “+” and are combined in one part number. When ordering, the single pumps should be ordered according to type code.

Notice

- The combination pump type code is shown in shortened form in the order confirmation.

Example:

AA4VSO 250LR2D/30R+AA4VSO 250LR2D/30R

- Each through drive is plugged with a **non-pressure resistant** cover. Before commissioning the units, they must therefore be equipped with pressure-resistant covers. Through drives can also be ordered with a pressure-resistant cover. Please specify in plain text.

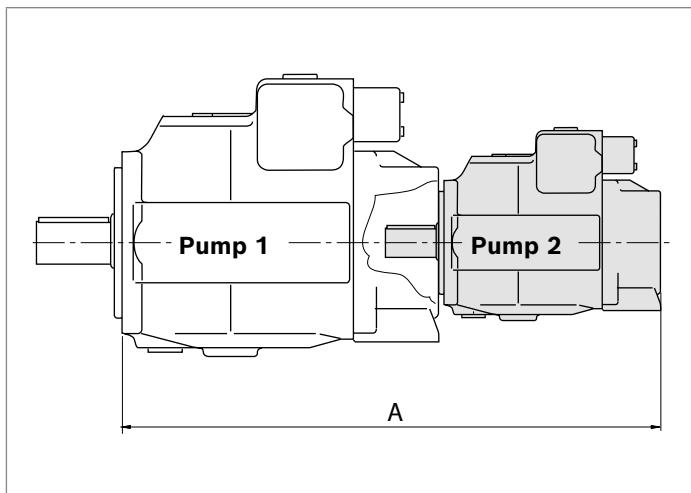

Order example:

AA4VSO 250LR2D/30R-PZB25U35

AA4VSO 250LR2D/30R-PZB25N00

It is permissible to use a combination of two single pumps of the same size (tandem pump), considering a dynamic mass acceleration of maximum 10 g (= 98.1 m/s²) without additional support brackets.

For combination pumps consisting of more than two pumps, the mounting flange must be rated for the permissible moment of inertia.

Installation instructions

General

The axial piston unit must be filled with hydraulic fluid and air bled during commissioning and operation. This must also be observed following a longer shutdown as the axial piston unit may empty via the hydraulic lines.

Particularly in the installation position "drive shaft upwards", filling and air bleeding must be carried out completely as there is, for example, a danger of dry running.

The leakage in the housing area must be directed to the reservoir via the highest drain port (**T**, **K₁**, **K₂**, **R(T)**).

For combination pumps, the leakage must be drained off at each pump.

If a shared drain line is used for several units, make sure that the case pressure in each unit is not exceeded. The shared drain line must be sized to ensure that the maximum permissible case pressure of all connected units is not exceeded in any operating conditions, particularly on cold start. If this is not possible, lay separate drain lines, if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the suction line and drain line must flow into the reservoir below the minimum fluid level. The permissible suction height h_s results from the total pressure loss. However, it must not be higher than $h_{s\ max} = 31.50$ inch (800 mm). The minimum suction pressure at port **S** must also not fall below 12 psi (0.8 bar) absolute (without charge pump) or 10 psi (0.7 bar) absolute (with charge pump) during operation and during a cold start.

When designing the reservoir, ensure adequate distance between the suction line and the case drain line. This prevents the heated, and possible foaming return flow from being drawn directly back into the suction line.

Notice

In certain installation positions, an influence on the control or closed loop control can be expected. Gravity, dead weight and case pressure can cause minor characteristic shifts and changes in response time.

Installation position

See the following examples **1** up to **7**.

Further installation positions are available upon request.

Recommended installation position: **1** and **2**

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir and below the minimum fluid level of the reservoir.

Installation position	Air bleed	Filling
1	R(L) + F	S + R(L)
2	T + F	S + T
3	T + F	S + T + U

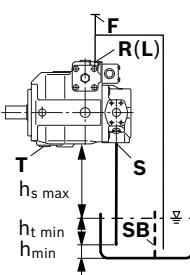

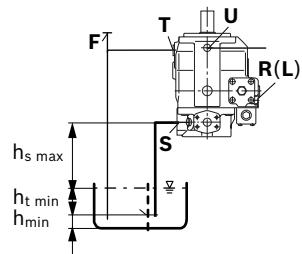

For key, see page 67

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir. Observe the maximum permissible suction height

$h_{S\ max} = 31.50$ inch (800 mm).

The above reservoir installation is not recommended for sizes 180 to 1000 and is not permissible for units with charge pump (A4VSLO).

Installation position	Air bleed	Filling
4	$F + R(L)$	$R(L) + F$
		
5 ¹⁾	$F + T$	$T + F + U$
		
Key		
R(L)	Filling/air bleeding	
S	Suction port	
T	Drain port	
U	Flushing port	
K₁, K₂	Flushing port	
SB	Baffle (baffle plate)	
$h_{t\ min}$	Minimum required immersion depth (7.87 inch (200 mm))	
h_{min}	Minimum required distance to reservoir bottom (3.94 inch (100 mm))	
$h_{S\ max}$	Maximum permissible suction height (31.50 inch (800 mm))	

¹⁾ For the high-speed version, P_{HD} must be filled.

Inside-reservoir installation

Inside-reservoir installation is when the axial piston unit is installed in the reservoir below the minimum fluid level. The axial piston unit is completely below the hydraulic fluid.

If the minimum fluid level is equal to or below the upper edge of the pump, see chapter "**Above reservoir installation**".

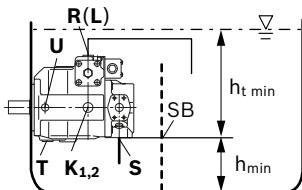

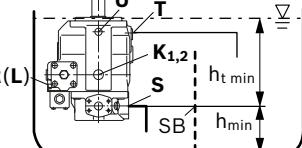

Axial piston units with electrical components (e.g., electric control, sensors) may not be installed in a reservoir below the fluid level.

The exception is adjustment HS5M

The proportional valve can be positioned separately and the piping installed at the connections **X₁** and **X₂** of the pump.

The unit can be installed in the reservoir together with the directly mounted position transducer.

Approved for HLP fluids DIN 51524.

Installation position	Air bleed	Filling
6	Via the highest port R(L)	Automatically via the open port R(L) , K_{1,2} due to the position under the hydraulic fluid level
		
7	Via the highest open port T, U	Automatically via the open port R(L) , T , K_{1,2} due to the position under the hydraulic fluid level
		

Notice

Port **F** is part of the external piping and must be provided on the customer side to make filling and air bleeding easier.

Project planning notes

- ▶ The (A)A4VSO axial piston variable pump is designed to be used in open circuit.
- ▶ The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified skilled personnel.
- ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, this can be requested from Bosch Rexroth.
- ▶ Before finalizing your design, please request a binding installation drawing.
- ▶ The specified data and notes must be observed. More information on the products can be found in the data sheets on page 1.
- ▶ Depending on the operating conditions of the axial piston unit (working pressure, fluid temperature), the characteristic curve may shift.
- ▶ The characteristic curve may also shift due to the dither frequency or control electronics.
- ▶ Preservation: Our axial piston units are supplied as standard with preservative protection for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of which can be found in the data sheet 90312 or in the instruction manual.
- ▶ Not all versions of the product are approved for use in safety functions according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. MTTF_d) for functional safety.
- ▶ Depending on the type of control used, electromagnetic effects can be produced when using solenoids. Use of the recommended direct current (DC) on the electromagnet does not produce any electromagnetic interference (EMI), nor is the electromagnet influenced by EMI. Potential electromagnetic interference (EMI) exists if the solenoid is energized with a modulated direct current (e.g. PWM signal). The machine manufacturer should conduct appropriate tests and take appropriate measures to ensure that other components or operators (e.g. with a pacemaker) are not affected by the potentiality.
- ▶ Pressure controllers are not safeguards against pressure overload. Be sure to add a pressure relief valve to the hydraulic system.
- ▶ For drives that are operated for a long period with constant rotational speed, the natural frequency of the hydraulic system can be stimulated by the excitation frequency of the pump (rotational speed frequency ×9). This can be prevented with suitably designed hydraulic lines.
- ▶ Please note the details regarding the tightening torques of port threads and other threaded joints in the instruction manual.
- ▶ Working ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The working ports and function ports are only intended to accommodate hydraulic lines.

Safety instructions

- ▶ During and shortly after operation, there is a risk of getting burnt on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
- ▶ Moving parts in control equipment (e.g. valve spools) can, under certain circumstances, get stuck in position as a result of contamination (e.g. impure hydraulic fluid, abrasion, or residual dirt from components). As a result, the hydraulic fluid flow and the build-up of torque in the axial piston unit can no longer meet the operator's specifications. Even the use of various filter elements (external or internal flow filtration) will not rule out a fault but merely reduce the risk. The machine/system manufacturer must test whether remedial measures are needed on the machine for the application concerned in order to set the consumer being driven to a safe position (e.g. safe stop) and if necessary to ensure it is properly implemented.
